

C-Series Induction Sealers

An efficient platform, optimized for your line

Our C-Series induction sealers are designed to be easy-to-use, lower powered alternatives to our flagship iFoil. Utilizing the 1kW C-series power supply and universal sealing coil, the C-Series induction sealers come in three configurations which allow you to maximize the utility of your sealer.

The CS1 configuration is a stationary mounted induction sealer with a minimal footprint, designed to be mounted to an existing production line with minimal mechanical work required.

The CP1 configuration (shown on the right) is built onto a stainless-steel portable cart for easy transport, ideal for packagers and manufacturers who need induction sealing at various points in their production line.

The CC1 configuration is built onto a portable conveyor belt for maximum convenience and flexibility, ideal for short runs and production lines without a conveyor.

Pillar Technologies' C-Series induction sealers are the perfect solution for packagers and manufacturers who need easy-to-use and effective induction sealing. And, thanks to the different configurations available, you can find a C-Series sealer that's right for your facility.
